1 [Instruction scheduling for the HP PA-8000](#)

David A. Dunn, Wei-Chung Hsu

December 1996 **Proceedings of the 29th annual ACM/IEEE international symposium on Microarchitecture**

Full text available:  [pdf \(1.15 MB\)](#)

Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

The PA-8000 is capable of reordering independent operations at run time, a task normally performed only by the instruction scheduler in the compiler. This paper presents some of the unique issues faced by an instruction scheduler for the PA-8000. Several features of the micro-architecture are presented along with the heuristics used in the production compiler to model that feature. These features include latency, resource constraints, instruction polarity cache interfaces, and memory dependences ...

Keywords: HP PA-8000, compiler optimization, instruction polarity cache interfaces, instruction scheduling, latency, memory dependences, micro-architecture, production compiler, resource constraints, scheduling
